

Figures and Tables

Figure 1: Associations between **(A)** Active lever presses during nicotine self-administration training (FR1-FR5 schedules of reinforcement) and cue-induced reinstatement of nicotine seeking ($p < 0.05$) and **(B)** Active lever presses during the progressive ratio schedule and cue-induced reinstatement of nicotine seeking ($p < 0.05$) in rats.

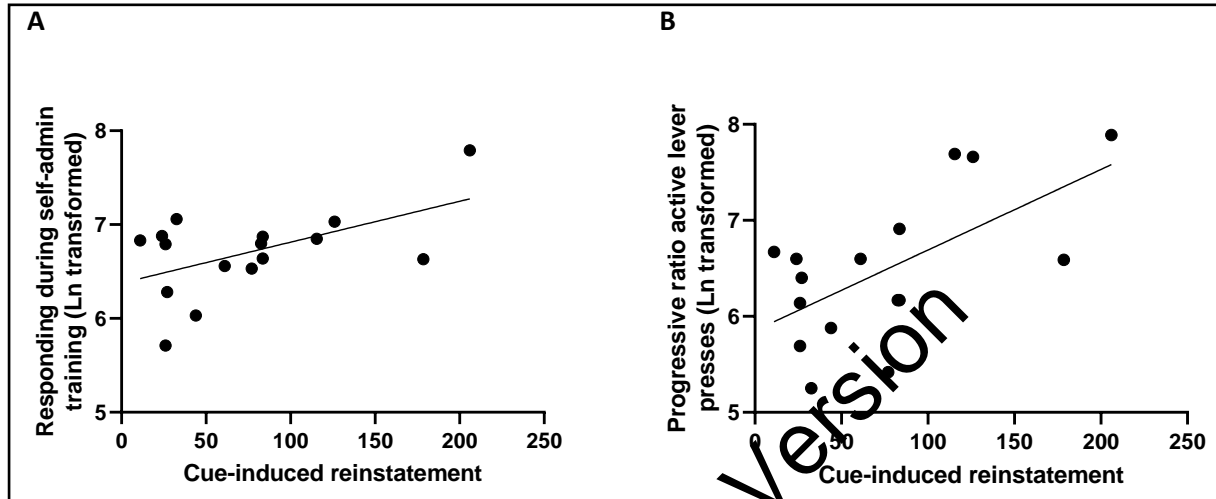

Table 1: Association between forced choice nicotine puffs and cue-induced craving in human smokers.

	β	t	Sig.
Intercept	-	1.86	0.067
FTND score	0.18	1.79	0.077
Years of smoking	-0.14	-1.39	0.169
Urge to smoke (induced by neutral cues)	0.02	0.16	0.871
Nicotine containing cigarette choices (%)*	-0.21	-2.15	0.034

β is the standardized regression coefficient, FTND is the Fagerstrom Test for Nicotine Dependence, * indicates that a log transformation of reflected data was used in the model.
